are Compatible CMBDFs

 $are {\tt Compatible CMBDFs}$ $are {\tt Compatible CMBDFs}$

Description

Compare attributes to decide if two CMBDataFrames are compatible

Usage

```
areCompatibleCMBDFs(cmbdf1, cmbdf2)
```

Arguments

Details

If the CMBDataFrames do not have compatible attributes then a message is printed indicating the attributes that do not match. To suppress this use the suppressMessages function

Examples

```
a <- CMBDataFrame(nside = 2, ordering = "ring", coords = "cartesian")
a <- CMBDataFrame(nside = 1, ordering = "nested", coords = "spherical")
areCompatibleCMBDFs(a,b)
suppressMessages(areCompatibleCMBDFs(a,b))</pre>
```

as.CMBDataFrame

as.CMBDataFrame

Description

Safely converts a data.frame to a CMBDataFrame. The rows of the data.frame are assumed to be in the HEALPix order given by ordering, and at the HEALPix resolution given by nside. Coordinates, if present, are checked to correspond to HEALPix pixel centers. The coordinates must be named either x,y,z (cartesian) or theta, phi (spherical colatitude and longitude respectively).

```
as.CMBDataFrame(df, ordering, nside, spix)
```

4 assumedConvex<-

Arguments

df Any data. frame whose rows are in HEALPix order

ordering character string that specifies the ordering scheme ("ring" or "nested")

nside an integer that specifies the Nside (resolution) HEALPix parameter

spix a vector that specifies the HEALPix pixel index corresponding to each row of

df. If spix is left blank and df is a data. frame, then df is assumed to contain data for every pixel at resolution parameter nside (the full sky). However, if spix is left blank and df is a CMBDataFrame, then spix is set equal to pix(df)

Value

A CMBDataFrame

assumedConvex

Check if a CMBWindow is assumed convex

Description

Check if a CMBWindow is assumed convex

Usage

```
assumedConvex(win, assume.convex)
```

Arguments

win a CMBWindow object

assume.convex optionally change the assumedConvex attribute to TRUE or FALSE

assumedConvex<-

Change the assumedConvex boolean of a CMBWindow

Description

Change the assumedConvex boolean of a CMBWindow

```
assumedConvex(win, ...) <- value</pre>
```

cbind.CMBDataFrame 5

|--|--|--|

Description

Add a new column or columns (vector, matrix or data.frame) to a CMBDataFrame. Note that method dispatch occurs on the first argument. So, the CMBDataFrame must be the first argument

Usage

```
## S3 method for class 'CMBDataFrame'
cbind(..., deparse.level = 1)
```

Details

See the documentation for cbind

Examples

```
cmbdf <- CMBDataFrame(nside = 1, ordering = "nested", coords = "spherical")
cmbdf2 <- cbind(cmbdf, myData = rep(1, 12))
cmbdf2</pre>
```

CMBDataFrame

CMBDataFrame class

Description

The function CMBDataFrame creates objects of class CMBDataFrame. These are a special type of data.frame that carry metadata about, e.g., the HEALPix ordering scheme, coordinate system, and nside parameter.

Usage

```
CMBDataFrame(CMBData, coords, win, include.polar = FALSE,
  include.masks = FALSE, spix, sample.size, nside, ordering, I, ...)
```

Arguments

CMBData	Can be a string location of FITS file, another CMBDataFrame, a CMBDat object, or unspecified.
coords	Can be "spherical," "cartesian", or unspecified (HEALPix only).
win	optional CMBWindow object that specifies a spherical polygon within which to subset the full sky CMB data.
include.polar	TRUE if polarisation data is required, otherwise FALSE.
include.masks	TRUE if TMASK and PMASK are required, otherwise FALSE.

6 CMBReadFITS

spix	Optional vector of sample pixel indices, or a path to a file containing comma delimited sample pixel indices. The ordering scheme is given by ordering. If ordering is unspecified then CMBData must be either a CMBDataFrame or a FITS file and the ordering scheme is then assumed to match that of CMBData.
sample.size	If a positive integer is given, a simple random sample of size equal to sample.size will be taken from CMBData. If spix is specified then sample.size must be unspecified.
nside	Optionally specify the nside parameter manually (usually 1024 or 2048).
ordering	Specifies the desired HEALPix ordering scheme ("ring" or "nested") for the output CMBDataFrame. If ordering is unspecified then the ordering scheme will be taken from the CMBData object, which must then be either a CMBDataFrame or a path to a FITS file. This parameter also specifies the ordering scheme of spix.
I	A vector of intensities to be included if CMBData is unspecified. Note that length(I) must equal $12*nside^2$ if either spix or sample.size are unspecified.
•••	Optional names data columns of length nrow(CMBData) to add to the CMB-DataFrame.

Value

A CMBDataFrame whose row.names attribute contains HEALPix indices.

Examples

```
## Method 1: Read the data while constructing the CMBDataFrame
df <- CMBDataFrame("CMB_map_smica1024.fits")

# Specify a sample size for a random sample
df.sample <- CMBDataFrame(df, sample.size = 800000)
plot(df.sample)

# Specify a vector of pixel indices using spix
df.subset <- CMBDataFrame(df, spix = c(2,4,6))

# Take a look at the summary
summary(df)

# Access HEALPix pixel indices using pix function
# (these are stored in the row.names attribute)
pix(df)</pre>
```

CMBReadFITS

Read CMB data from a FITS file.

Description

CMBReadFITS is adapted from the readFITS function in package FITSio. CMBReadFITS is in development stage and will only work with 'CMB_map_smica1024.fits'. When it works, CMBReadFITS is much faster than readFITS. However, readFITS is more general and so is more likely to work.

CMBWindow 7

Usage

```
CMBReadFITS(filename, mmap = FALSE, spix)
```

Arguments

filename The path to the fits file.

mmap A boolean indicating whether to use memory mapping.

spix The sample pixels (rows) to read from the FITS file binary data table (optional)

Value

A list containing header information and other metadata as well as an element called data where: If mmap = FALSE then a data. frame is included, named data, whose columns may include, for example, the intensity (I), polarisation (Q, U), PMASK and TMASK. If mmap = TRUE then a mmap object is returned that points to the CMB map data table in the FITS file.

Examples

```
dat <- CMBReadFITS("CMB_map_smica1024.fits")

# View metadata
dat$header1
dat$header2
dat$resoln
dat$method
dat$coordsys
dat$nside
dat$hdr</pre>
```

CMBWindow

CMBWindow

Description

Create a CMBWindow: Either a polygon or a disc type

Usage

```
CMBWindow(..., r, set.minus = FALSE, assume.convex = FALSE)
```

Arguments

these arguments are compulsory and must be labelled either x, y, z (cartesian) or theta, phi (spherical, colatitude and longitude respectively). Alternatively, a single data.frame may be passed in with columns labelled x, y, z or theta, phi.

r if a disc type window is required then this specifies the radius of the disc when TRUE the window will be the unit sphere minus the window specified when TRUE the window is assumed to be convex resulting in a faster computation time when the window is used with functions such as subWindow. This argument is irrelevant when the window is not a polygon

8 coords.CMBDataFrame

Details

If r is unspecified then the rows of . . . correspond to counter-clockwise ordered vertices defining a spherical polygon lying entirely within one open hemisphere on the unit sphere. Counter-clockwise is understood from the perspective outside the sphere, facing the hemisphere that contains the polygon, looking toward the origin. Note that there must be at least 3 rows (vertices) to define a polygon (we exlude bygons). On the other hand, if r is specified then . . . must specify just one row, and this row is taken to be the center of a disc of radius r

Examples

```
win <- CMBWindow(theta = c(0,pi/2,pi/2), phi = c(0,0,pi/2))
```

coords.CMBDataFrame

Coordinate system from a CMBDataFrame

Description

This function returns the coordinate system used in a CMBDataFrame. The coordinate system is either "cartesian" or "spherical"

Usage

```
## S3 method for class 'CMBDataFrame'
coords(cmbdf, new.coords)
```

Arguments

cmbdf a CMBDataFrame.

new.coords specifies the new coordinate system ("spherical" or "cartesian") if a change of

coordinate system is desired.

Details

If a new coordinate system is specified, using e.g. new.coords = "spherical", the coordinate system of the CMBDataFrame will be converted.

Value

If new.coords is unspecified, then the name of the coordinate system of cmbdf is returned. Otherwise a new CMBDataFrame is returned equivalent to cmbdf but having the desired change of coordinates

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
coords(df)
coords(df, new.coords = "cartesian")</pre>
```

coords.CMBWindow 9

coords	CMBWindow

Coordinate system from a CMBWindow

Description

This function returns the coordinate system used in a CMBWindow. The coordinate system is either "cartesian" or "spherical"

Usage

```
## S3 method for class 'CMBWindow'
coords(win, new.coords)
```

Arguments

new.coords specifies the new coordinate system ("spherical" or "cartesian") if a change of

coordinate system is desired

cmbdf a CMBWindow.

Details

If a new coordinate system is specified, using e.g. new.coords = "spherical", the coordinate system of the CMBWindow will be converted

Value

If new.coords is unspecified, then the name of the coordinate system of win is returned. Otherwise a new CMBWindow is returned equivalent to win but having the desired change of coordinates

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
coords(df)
coords(df, new.coords = "cartesian")</pre>
```

coords.data.frame

Change the coordinate system of a data.frame

Description

Change the coordinate system of a data.frame

```
## S3 method for class 'data.frame'
coords(df, new.coords)
```

10 covCMB

Arguments

df a data.frame with columns labelled x, y, z (for cartesian) or theta, phi (for spher-

ical colatitude and longitude respectively)

new. coords specifies the new coordinate system ("spherical" or "cartesian").

Value

A new data.frame whose coordinates are as specified by new.coords

Description

Assign new coords system to CMBDataFrame

Usage

```
## S3 replacement method for class 'CMBDataFrame'
coords(cmbdf, ...) <- value</pre>
```

coords<-.CMBWindow

Assign new coordinate system to CMBWindow

Description

Assign new coordinate system to CMBWindow

Usage

```
## S3 replacement method for class 'CMBWindow'
coords(win, ...) <- value</pre>
```

covCMB

Covariance for CMB

Description

This function provides an empirical covariance estimate for data in a CMBDataFrame or data.frame. It places data into bins.

```
covCMB(cmbdf, num.bins = 10, sample.size, max.dist = pi, breaks,
  equiareal = TRUE, calc.max.dist = FALSE)
```

Arguments

cmbdf is a CMBDataFrame or data.frame specifies the number of bins num.bins sample.size optionally specify the size of a simple random sample to take before calculating covariance. This may be useful if the full covariance computation is too slow. an optional number between 0 and pi specifying the maximum geodesic distance max.dist to use for calculating covariance. Only used if breaks is unspecified. breaks optionally specify the breaks manually using a vector giving the break points between cells. This vector has length num.bins since the last break point is taken as max.dist. If equiareal = TRUE then these breaks should be $cos(r_i)$ where r_i are radii. If equiareal = FALSE then these breaks should be r_i . equiareal if TRUE then the bins have equal spherical area. If false then the bins have equal annular widths. Default is TRUE. if TRUE then the max.dist will be calculated from the locations in cmbdf. calc.max.dist

Value

An object of class CMBCovariance consisting of a data. frame containing sample covariance values, bin centers, and number n of data point pairs whose distance falls in the corresponding bin. The first row of this data.frame corresponds to the sample variance. The attribute "breaks" contains the break points used. The returned data.frame has num.bins + 1 rows since the first row, the sample variance, is not counted as a bin.

Otherwise either max. dist must be specified or max. dist will default to pi.

geoArea. CMBDataFrame Geodesic area covered by a CMBDataFrame

Description

Gives the surface on the unit sphere that is encompassed by all pixels in cmbdf

Usage

```
## S3 method for class 'CMBDataFrame'
geoArea(cmbdf)
```

Arguments

cmbdf a CMBDataFrame

Value

the sum of the areas of all pixels (rows) in cmbdf

12 geoDist

geoArea.CMBWindow

Get the geodesic area of a CMBWindow

Description

Get the geodesic area of a CMBWindow

Usage

```
## S3 method for class 'CMBWindow'
geoArea(win)
```

Arguments

win

a CMBWindow

Value

Tthe spherical area inside win

geoDist

Geodesic distance on the unit sphere

Description

Geodesic distance on the unit sphere

Usage

```
geoDist(p1, p2)
```

Arguments

р1

a 3 element vector on the unit sphere given in Cartesian coordinates (x,y,z), or a 2 element vector (theta, phi) giving spherical coordinates, can also be a data.frame or matrix with rows specifying vectors

p2

a vector on the unit sphere given in Cartesian coordinates (x,y,z) or a named vector (theta, phi) giving spherical coordinates, can also be a data.frame or matrix with rows specifying vectors

Value

The geodesic distance between p1 and p2

header 13

header

Get the FITS headers from a CMBDataFrame

Description

Get the FITS headers from a CMBDataFrame

Usage

header(cmbdf)

Arguments

 ${\sf cmbdf}$

a CMBDataFrame.

Value

The FITS headers belonging to the FITS file from which cmbdf data was imported

is.CMBDat

Check if an object is of class CMBDat

Description

Check if an object is of class CMBDat

Usage

is.CMBDat(cmbdf)

Arguments

cmbdf

Any R object

Value

TRUE if cmbdf is a CMBDat object, otherwise FALSE

is.CMBWindow

is.CMBDataFrame

Check if an object is of class CMBDataFrame

Description

Check if an object is of class CMBDataFrame

Usage

is.CMBDataFrame(cmbdf)

Arguments

 ${\sf cmbdf}$

Any R object

Value

TRUE if cmbdf is a CMBDataFrame, otherwise FALSE

is.CMBWindow

Check if an object is a CMBWindow

Description

Check if an object is a CMBWindow

Usage

is.CMBWindow(win)

Arguments

win

any object

Value

TRUE or FALSE depending if win is a CMBWindow

JacobiRecursive 15

JacobiRecursive Calculate Jacobi polynomial values of degree L at given point T in [-1,1].

Description

Calculate Jacobi polynomial values of degree L at given point T in [-1,1].

Usage

```
JacobiRecursive(a, b, L, T)
```

Arguments

L The degree of Jacobi polynomial

T Given point in [-1,1].

(a, b) The parameters of Jacobi polynomial

Value

Jacobi polynomial values

Source

```
http://dlmf.nist.gov/18.9
```

Examples

```
JacobiRecursive(0,0,5,0)
JacobiRecursive(1,2,4,0.5)
```

maxDist.CMBDataFrame

 ${\it Get the maximum distance between all points in a {\tt CMBDataFrame}}$

Description

Get the maximum distance between all points in a CMBDataFrame

Usage

```
## S3 method for class 'CMBDataFrame'
maxDist(cmbdf)
```

Arguments

cmbdf

a CMBDataFrame object

16 nest2ring

maxDist.CMBWindow

Get the maximum distance between all points in a CMBWindow

Description

Get the maximum distance between all points in a CMBWindow

Usage

```
## S3 method for class 'CMBWindow'
maxDist(win)
```

Arguments

win

a CMBWindow object

minDist

minDist

Usage

```
minDist(cmbdf, point)
```

Arguments

cmbdf

a data.frame or CMBDataFrame

point

a point on the unit sphere in cartesian coordinates

Value

the shortest distance from point to cmbdf

nest2ring

nest2ring

Description

Convert from "nested" to "ring" ordering

nest2ring computes the HEALPix pixel index in the "ring" ordering scheme from the pixel index in the "nested" ordering scheme.

```
nest2ring(nside, pix)
```

nestSearch 17

Arguments

nside is the HEALPix nside parameter.

pix is the set or subset of pixel indices at nside. If pix is left blank then all pixels are

converted.

Value

the output is the corresponding set of pixel in the ring ordering scheme.

nestSearch Nested Search

Description

Finds the closest HEALPix pixel center to a given target point, specified in Cartesian coordinates, using an efficient nested search algorithm. HEALPix indices are all assumed to be in the "nested" ordering scheme.

Usage

```
nestSearch(target, nside, index.only = FALSE, j = 0:log2(nside),
  demo.plot = FALSE)
```

Arguments

target is a vector of Cartesian coordinates for the target point on S^2

nside is the nside for which the HEALPix points are searched

pixel at each step in red

Value

if index.only = TRUE then the output will be a HEALPix index. If index.only FALSE then the output is the list containing the HEALPix index and Cartesian coordinate vector of the HEALPix point closest to target.

Examples

```
# Find the pix index and Cartesian coordinates of the HEALPix point # at nside closest to the target point c(0,0,1) h <- nestSearch(c(0,0,1), nside=1024) cat("Closest HEALPix point to (0,0,1) at nside = 1024 is (",h$xyz,")")
```

18 nestSearch_step

Description

Search for the closest HEALPix pixel to a target point, where the search is restricted to within HEALPix pixel, pix.j1, at resolution j1. The returned value is a HEALPix pixel (and, optionally, the cartesian coordinates of its center) at resolution j2, where j2 > j1. All pixels are assumed to be in nested ordering scheme.

Usage

```
nestSearch_step(target, j1 = j2, j2, pix.j1 = 0, demo.plot = FALSE)
```

Arguments

target	is the target point on S^2 in spherical coordinates.
j1	is the lower resolution, with $j1 < j2$.
j2	is the upper resolution.
pix.j1	is the initial pix index at resolution j1, i.e., the j1-level pixel to search in. If $pix.j1 = 0$ then all pixels will be searched (slow).
demo.plot	If TRUE then a plot will be produced with target pixel in yellow and closest pixel in red

Details

```
j1 and j2 are HEALPix resolution parameters, i.e., nside = 2^{j}.
```

nestSearch_step(target, j2, j1, pix.j1) searches within the subregion pix.j1, where pix.j1 is a HEALPix pixel index at resolution j1. The return value is the HEALPix point closest to target, at resolution j2.

Setting pix.j1 = 0 (the default) searches for the HEALPix point closest to target at resolution j2, among all HEALPix points at resolution j1.

Value

A list containing the Cartesian coordinates, xyz, and the HEALPix pixel index, pix, of the closest HEALPix pixel center to the target point, target, at resolution j2

Examples

```
# search for the HEALPix pixel center closest to North pole # (0,0,1) at level 3 nestSearch_step(target = c(0,0,1), j2 = 3, j1 = -1, demo.plot = TRUE )
```

nside 19

nside

HEALPix Nside parameter from a CMBDataFrame

Description

This function returns the HEALPix Nside parameter of a CMBDataFrame

Usage

```
nside(cmbdf)
```

Arguments

cmbdf

a CMB Data Frame.

Value

The HEALPix Nside parameter

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
nside(df)</pre>
```

ordering

HEALPix ordering scheme from a CMBDataFrame

Description

This function returns the HEALPix ordering scheme from a CMBDataFrame. The ordering scheme is either "ring" or "nested".

Usage

```
ordering(cmbdf, new.ordering)
```

Arguments

cmbdf a CMB Data Frame.

new.ordering specifies the new ordering ("ring" or "nest") if a change of ordering scheme is

desired.

Details

If a new ordering is specified, using e.g. new.ordering = "ring", the ordering scheme of the CMB-DataFrame will be converted.

Value

The name of the HEALPix ordering scheme that is used in the CMBDataFrame cmbdf

20 pix

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
ordering(df)
ordering(df, new.ordering = "ring")</pre>
```

ordering<-

Assign new ordering scheme to CMBDataFrame

Description

Assign new ordering scheme to CMBDataFrame

Usage

```
ordering(cmbdf, ...) <- value</pre>
```

pix

 $HEALPix\ pixel\ indices\ from\ {\tt CMBDataFrame}$

Description

If new.pix is unspecified then this function returns the vector of HEALPix pixel indices from a CMBDataFrame. If new.pix is specified then this function returns a new CMBDataFrame with pixel indices new.pix

Usage

```
pix(cmbdf, new.pix)
```

Arguments

cmbdf a CMBDataFrame.

new.pix optional vector of pixel indices

Value

The vector of HEALPix pixel indices or, if new.pix is specified, a new CMBDataFrame.

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
pix(df)</pre>
```

pix2coords 21

pix2coords pix2coords

Description

convert HEALPix pixel indices to cartesian or spherical coordinates

Usage

```
pix2coords(nside, coords = "cartesian", ordering = "nested", spix)
```

Arguments

nside the nside parameter

coords 'cartesian' or 'spherical' coordinates

ordering 'ring' or 'nested' ordering

spix optional integer or vector of sample pixel indices

Value

```
a data.frame with columns 'x', 'y', 'z' (cartesian) or 'theta', 'phi' (spherical)
```

pix<-

Assign new pixel indices to a CMBDataFrame

Description

Assign new pixel indices to a CMBDataFrame

Usage

```
pix(cmbdf, ...) <- value</pre>
```

pixelArea

pixelArea

Description

Get the area of a single HEALPix pixel

Usage

```
pixelArea(cmbdf)
```

Arguments

cmbdf

a CMBDataFrame

Value

the area of a single HEALPix pixel at the nside resolution of cmbdf

22 plot.CMBDataFrame

elWindow Pixel window

Description

All pixels are assumed to be in nested ordering

Usage

```
pixelWindow(j1, j2, pix.j1)
```

Arguments

j1	is the lower resolution, with $j1 < j2$
j2	the upper resolution
pix.j1	the pixel index at resolution j1 within which all pixels from resolution j2 will be
	returned. pix.j1 can also be a vector of non-zero pixel indices.

Value

All pixels in resolution j2 that fall within the pixel pix.j1 specified at resolution j1

plot.CMBDataFrame Plot CMB Data

Description

This function produces a plot from a CMB Data Frame.

Usage

```
## S3 method for class 'CMBDataFrame'
plot(cmbdf, intensities = "I", add = FALSE,
   sample.size, type = "p", size = 1, box = FALSE, axes = FALSE,
   aspect = FALSE, col, back.col = "black", labels, ...)
```

Arguments

cmbdf	a CMB Data Frame with either spherical or cartesian coordinates.
intensities	the name of a column that specifies CMB intensities. This is only used if col is unspecified
add	if TRUE then this plot will be added to any existing plot. Note that if back.col (see below) is specified then a new plot window will be opened and add = TRUE will have no effect
sample.size	optionally specifies the size of a simple random sample to take before plotting. This can make the plot less computationally intensive
type	a single character indicating the type of item to plot. Supported types are: 'p' for points, 's' for spheres, 'l' for lines, 'h' for line segments from $z = 0$, and 'n' for nothing.

plot.CMBWindow 23

size	the size of plotted points
box	whether to draw a box
axes	whether to draw axes
aspect	either a logical indicating whether to adjust the aspect ratio, or a new ratio.
col	specify the colour(s) of the plotted points
back.col	optionally specifies the background colour of the plot. This argument is passed to rgl::bg3d.
labels	optionally specify a vector of labels to plot, such as words or vertex indices. If this is specified then rgl::text3d is used instead of rgl::plot3d. Then length(labels) must equal nrow(cmbdf)
	arguments passed to rgl::plot3d

Value

A plot of the CMB data

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits")
plot(df, sample.size = 800000)</pre>
```

plot.CMBWindow visualise a CMBWindow

Description

visualise a CMBWindow

Usage

```
## S3 method for class 'CMBWindow'
plot(win, add = TRUE, type = "1", col = "red",
    size = 2, box = FALSE, axes = FALSE, aspect = FALSE, back.col, ...)
```

Arguments

win	a CMBWindow
add	if TRUE then this plot will be added to any existing plot. Note that if back.col (see below) is specified then a new plot window will be opened and add = TRUE will have no effect
type	a single character indicating the type of item to plot. Supported types are: 'p' for points, 's' for spheres, 'l' for lines, 'h' for line segments from $z=0$, and 'n' for nothing.
col	specify the colour(s) of the plotted points
size	the size of plotted points
box	whether to draw a box
axes	whether to draw axes
size box	for nothing. specify the colour(s) of the plotted points the size of plotted points whether to draw a box

24 plotHPBoundaries

aspect	either a logical indicating whether to adjust the aspect ratio, or a new ratio.
back.col	specifies the background colour of the plot. This argument is passed to rgl::bg3d.
•••	arguments passed to rgl::plot3d
eps	the geodesic distance between consecutive points to draw on the window boundary

plotHPBoundaries

plotHPBoundaries

Description

plot the HEALPix pixel boundaries at nside

Usage

```
plotHPBoundaries(nside, eps = pi/90, col = "black", lwd = 1, ordering,
  incl.labels = 1:(12 * nside^2), nums.col = col, nums.size = 1,
  font = 2, ...)
```

Arguments

nside	the HEALPix nside parameter
eps	controls the smoothness of the plot, smaller eps implies more samples
col	the colour of plotted boundary lines
lwd	the thickness of the plotted boundary lines
ordering	optionally specify an ordering scheme from which to plot HEALPix pixel numbers. Can be either "ring" or "nested"
incl.labels	If ordering is specified then this parameter sets the pixel indices that will be displayed (default is all indices at nside)
nums.col	specifies the colour of pixel numbers if ordering is specified
nums.size	specifies the size of pixel numbers if ordering is specified
font	A numeric font number from 1 to 5, used if ordering is specified
	arguments passed to rgl::plot3d

Value

produces a plot

print.CMBDataFrame 25

Description

This function neatly prints the contents of a CMB Data Frame.

Usage

```
## S3 method for class 'CMBDataFrame'
print(cmbdf, ...)
```

Arguments

```
cmbdf a CMB Data Frame.
... arguments passed to print.tbl_df
```

Value

Prints contents of the CMB data frame to the console.

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits", sample.size = 800000)
print(df)
df</pre>
```

```
print.summary.CMBDataFrame
```

Print a summary of a CMBDataFrame

Description

Print a summary of a CMBDataFrame

Usage

```
## S3 method for class 'summary.CMBDataFrame' print(x, ...)
```

Arguments

```
x \hspace{1cm} a \hspace{1cm} summary . \hspace{1cm} CMBDataFrame \hspace{1cm} object, \hspace{1cm} i.e., \hspace{1cm} the \hspace{1cm} output \hspace{1cm} of \hspace{1cm} summary . \hspace{1cm} CMBDataFrame \hspace{1cm}
```

26 rcosmo

```
print.summary.CMBWindow
```

Print a summary of a CMBWindow

Description

Print a summary of a CMBWindow

Usage

```
## S3 method for class 'summary.CMBWindow'
print(x, ...)
```

Arguments

Х

a summary. CMBWindow object, i.e., the output of summary. CMBWindow

rbind.CMBDataFrame

Like rbind for CMBDataFrames

Description

Add a new row or rows to a CMBDataFrame. All arguments passed to . . . must be CMBDataFrames.

Usage

```
## S3 method for class 'CMBDataFrame'
rbind(..., deparse.level = 1, unsafe = FALSE)
```

Arguments

unsafe

defaults to FALSE. If unsafe = TRUE then overlapping pixel coordinates will not throw an error (faster).

See the documentation for rbind

rcosmo

rcosmo - This Documentation is a place holder.

Author(s)

Daniel Fryer <d.fryer@latrobe.edu.au>

resolution

 $Get \ the \ arcmin \ resolution \ from \ a \ {\tt CMBDataFrame}$

Description

Get the arcmin resolution from a CMBDataFrame

Usage

resolution(cmbdf)

Arguments

cmbdf

a CMBDataFrame.

Value

The arcmin resolution as specified by the FITS file where the data was sourced

ring2nest

Ring to Nest.

Description

ring2nest converts HEALPix pixel indices in the 'ring' ordering scheme to HEALPix pixel indices in the 'nested' ordering scheme.

Usage

```
ring2nest(nside, pix)
```

Arguments

nside

is the HEALPix nside parameter.

pix

is a vector of HEALPix pixel indices, in the 'ring' ordering scheme.

Value

the output is a vector of HEALPix pixel indices in the 'nested' ordering scheme.

28 SphericalHarmonics

Examples

```
# compute HEALPix indices in the ring order of the set pix given in the nest order at nside nside <- 8 pix <-c(1,2,23) ring2nest(nside,pix)
```

sampleCMB

Take a simple random sample from a CMBDataFrame

Description

This function returns a CMBDataFrame with size sample.size, whose rows comprise a simple random sample of the rows from the input CMBDataFrame.

Usage

```
sampleCMB(cmbdf, sample.size)
```

Arguments

cmbdf a CMB Data Frame. sample.size the desired sample size.

Value

A CMBDataFrame with size sample.size, whose rows comprise a simple random sample of the rows from the input CMBDataFrame.

Examples

```
df <- CMBDataFrame("CMB_map_smica1024.fits")
plot(sampleCMB(df, sample.size = 800000))</pre>
```

SphericalHarmonics

Compute spherical harmonic values at given points on the sphere.

Description

The function SphericalHarmonics computes the spherical harmonic values on the given 3D Cartesian coordinates.

```
SphericalHarmonics(L, m, xyz)
```

subWindow 29

Arguments

	CC1 1	C 1 ' 1	
	The degree	of spherical	harmonic
L .	The degree	or spirerical	marmonic

m The order number of the degree-L spherical harmonic

xyz Given points in 3D cartesian coordinates

Value

The spherical harmonic values

Hesse, K., Sloan, I. H., & Womersley, R. S. (2010). Numerical integration on the sphere. In Handbook of Geomathematics (pp. 1185-1219). Springer Berlin Heidelberg.

Examples

```
Spherical Harmonics (5,2,c(\emptyset,1,\emptyset)) \\ Spherical Harmonics (5,2,diag(3)) \\
```

|--|

Description

Restricts a CMBDataFrame, CMBDat object, or data.frame to a CMBWindow region. A single CMB-Window or a list of CMBWindows can be passed to the win argument.

Usage

```
subWindow(cmbdf, win, intersect = TRUE, in.pixels, in.pixels.res = 0)
```

Arguments

cmbdf	a CMBDataFrame, a data. frame, or CMBDat object. If this is a data.frame then it must have columns labelled x,y,z specifying cartesian coordinates, or columns labelled theta, phi specifying colatitude and longitude respectively.
win	a CMBWindow or a list of CMBWindows
intersect	a boolean that determines the behaviour when win is a list (see details).
in.pixels	a vector of pixels at resolution in.pixels.res whose union contains the window(s) win entirely. This will only be used if cmbdf is a CMBDataFrame
in.pixels.res	a resolution (i.e., j such that nside = 2^j) at which the in.pixels parameter is specified

Details

Windows that are tagged with set.minus (see CMBWindow) are treated differently from other windows: Let A be the union of the interiors of all windows whose winType does not include "minus", and let B be the intersection of the exteriors of all the windows whose winType does include "minus". Then, provided that intersect = TRUE (the default), the returned CMBDataFrame will be the intersection of the points in cmbdf with A and B. Otherwise, if intersect = FALSE, the returned CMBDataFrame will be the intersection of the points in cmbdf with the union of A and B. Note that if A (resp. B) is empty then the returned CMBDataFrame will be the intersection of B (resp. A) with cmbdf.

Value

a CMBDataFrame, or just a data.frame, which is restricted to the region of the sky specified by win

```
summary.CMBDataFrame Summarise a CMBDataFrame
```

Description

This function produces a summary from a CMBDataFrame.

Usage

```
## S3 method for class 'CMBDataFrame'
summary(cmbdf, intensities = "I")
```

Arguments

cmbdf a CMBDataFrame.

intensities the name of a column specifying CMB intensities (or potentially another nu-

meric quantity of interest)

Value

A summary

summary.CMBWindow Summarise a CMBWindow

Description

This function produces a summary from a CMBWindow

```
## S3 method for class 'CMBWindow'
summary(win)
```

triangulate 31

Arguments

 ${\sf cmbdf}$

a CMBWindow

Value

A summary

triangulate

Triangulate a polygonal CMBWindow

Description

Triangulate a polygonal CMBWindow

Usage

triangulate(win)

Arguments

win

a CMBWindow object

Value

a list of CMBWindow polygons or minus.polygons, each having 3 vertices and representing a triangle. These triangles have pairwise disjoint interiors and their union is equal to the original polygon, win.

window

Window attribute of CMBDataFrame

Description

When new.window or in.pixels is unspecified this function returns the CMBWindow attribute of a CMBDataFrame. The return value is NULL if the window is full sky. When new.window is specified this function instead returns a new CMBDataFrame whose CMBWindow attribute is new.window

```
window(cmbdf, new.window, intersect = TRUE, in.pixels, in.pixels.res = 0)
```

32 window<-

Arguments

cmbdf a CMBDataFrame.

new.window optionally specify a new window in which case a new CMBDataFrame is re-

turned whose CMBWindow is new.window. new.window may also be a list (see

details section).

intersect a boolean that determines the behaviour when win is a list (see details).

in.pixels a vector of pixels at resolution in.pixels.res whose union contains the win-

dow(s) win entirely, or if new.window is unspecified then this whole pixel is

returned

in.pixels.res a resolution (i.e., j such that nside = 2^j) at which the in.pixels parameter

is specified

Details

Windows that are tagged with set.minus (see CMBWindow) are treated differently from other windows. See subWindow for more details.

Value

The window attribute of cmbdf or, if new.window/in.pixels is specified, a new CMBDataFrame.

Examples

window<-

Assign a new CMBWindow to a CMBDataFrame

Description

Assign a new CMBWindow to a CMBDataFrame

```
window(cmbdf, ...) <- value</pre>
```

winType 33

winType Get the type (polygon or disk) of a CMBWindow	
---	--

Description

Get the type (polygon or disk) of a CMBWindow

Usage

```
winType(win, new.type)
```

Arguments

win a CMBWindow object or a list of such

new.type optionally specify a new type. Use this to change between "polygon" and "mi-

nus.polygon" or to change between "disc" and "minus.disc"

Value

If new.type is missing then the winType of win is returned. Otherwise a new window is returned with winType equal to new.type

winType<-

Assign new winType to a CMBWindow

Description

Assign new winType to a CMBWindow

```
winType(win, ...) <- value</pre>
```
